

Randomised Portfolios in Insurance

Mick Cooney mcooney@describedata.com

Introduction

Basic Concept

Insurance Use Cases

Random Portfolios

Risk/Reward Tradeoff

Risk Tolerance

Risk Limits

Only NASDAQ, NYSE listed stocks

No single stock greater than 5% of portfolio

Market Cap greater than 100M USD

No sector greater than 25% of portfolio

Key Finding

Portfolio performance is highly dependent on risk limits

Separate “alpha” from “beta”?

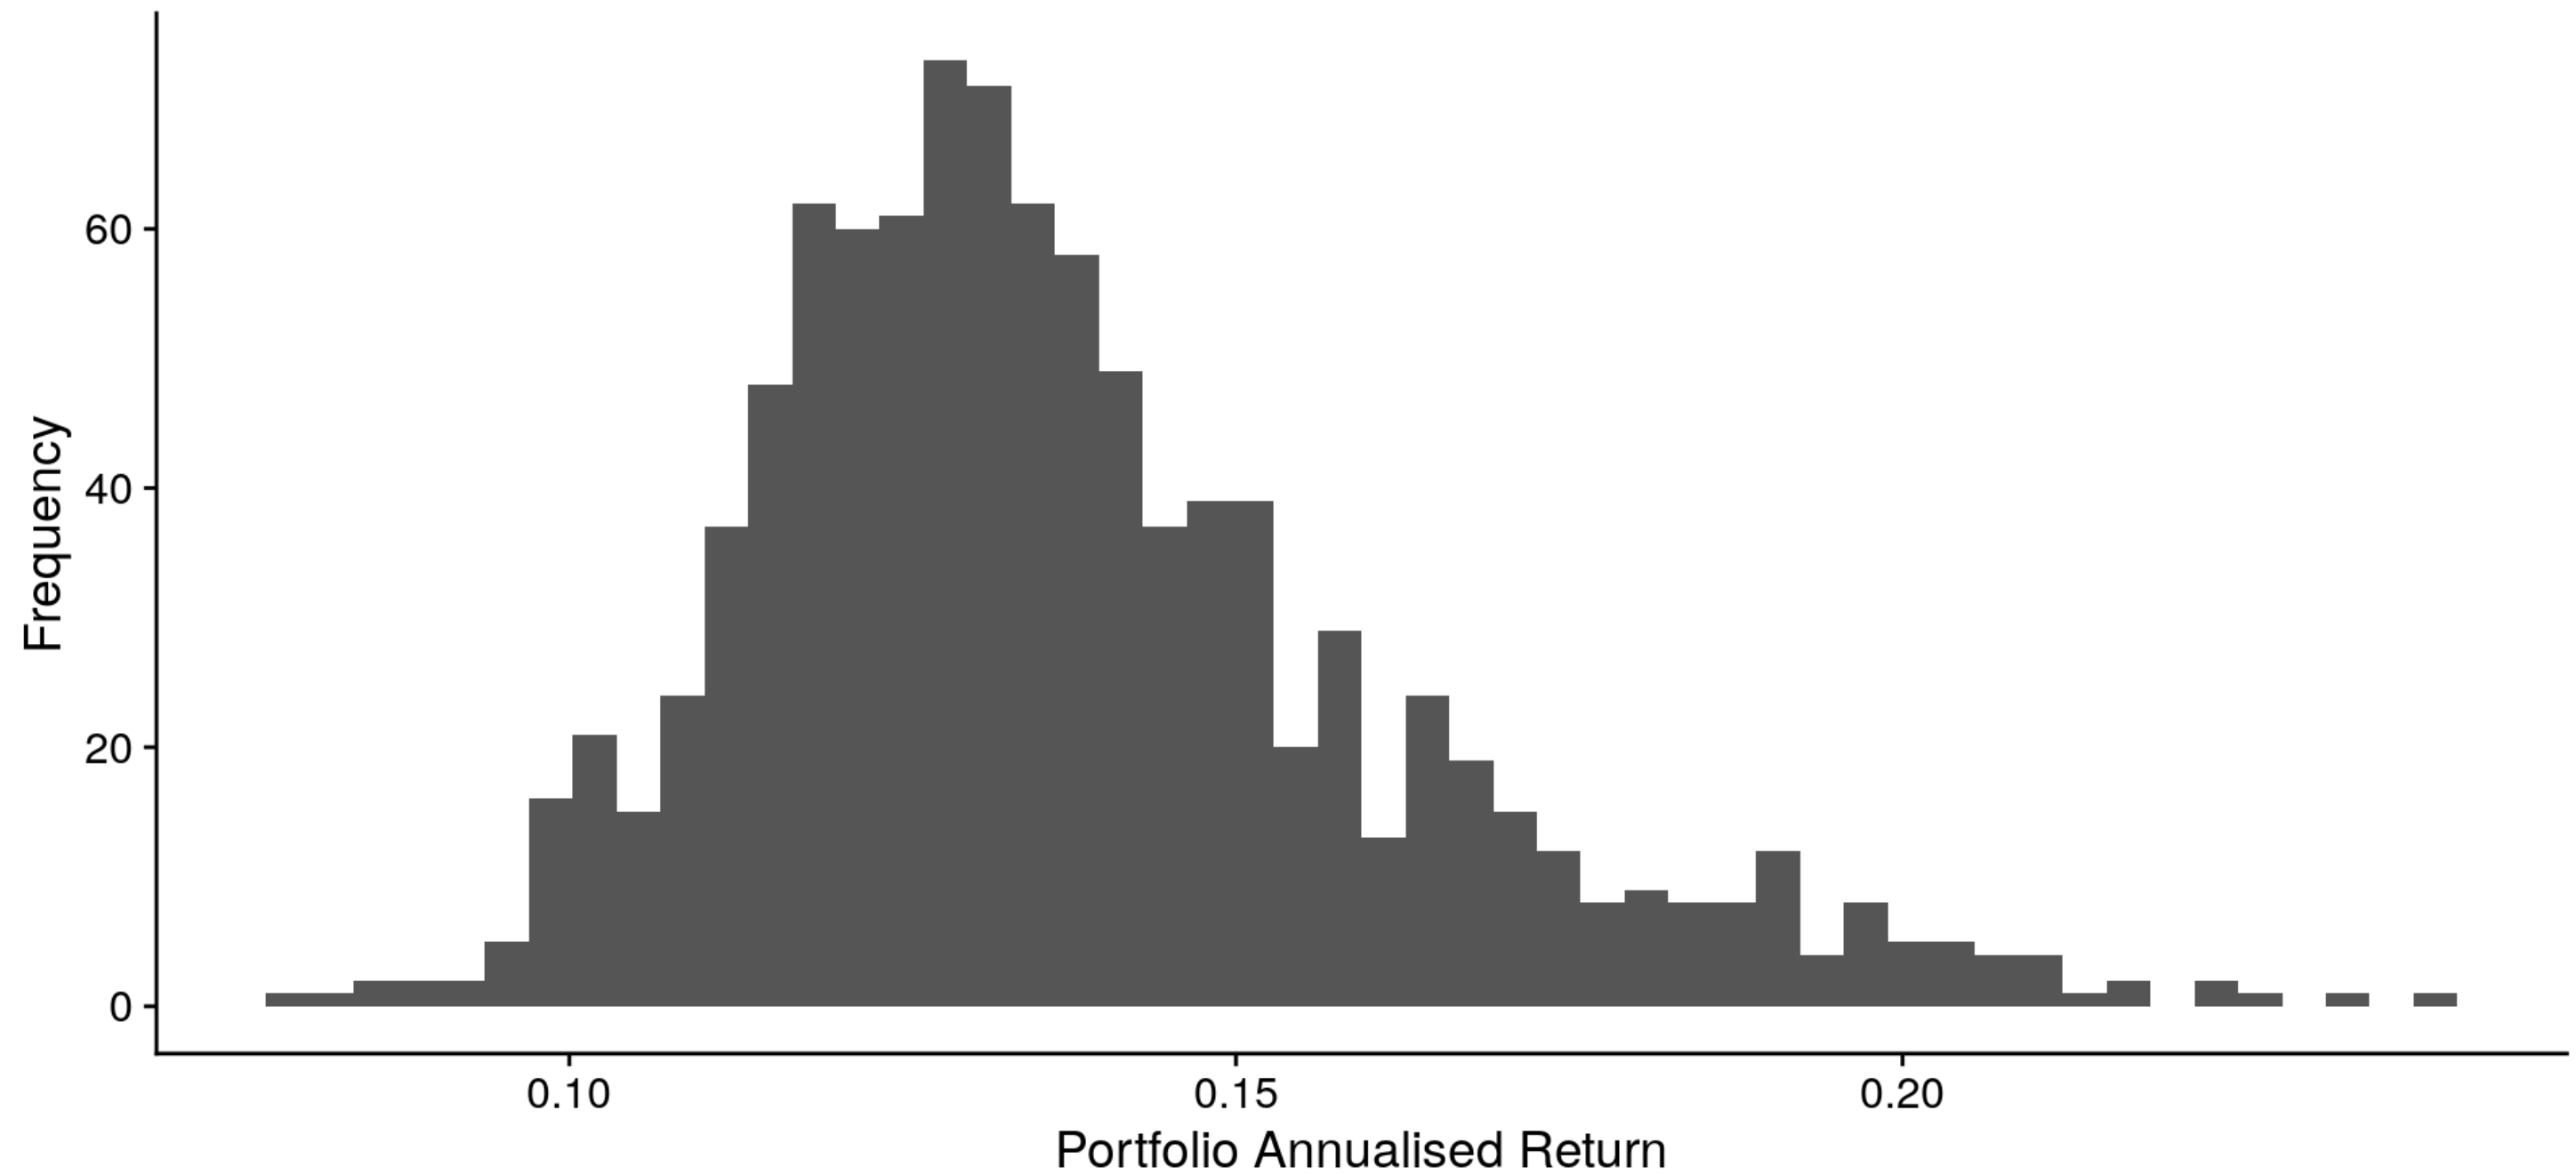

CAPM Model

$$r = \alpha + \beta m$$

Basic Approach

1. Generate random portfolios obeying risk limits
2. Measure performance of random portfolios
3. Compare actual with simulated returns

Histogram of Risk Profile Return Distribution

ECDF of the Simulated Returns

But what about insurance???

Steal the simple idea...

Use random portfolios of policies to do stuff

What sort of stuff?

Insurance Use Cases

Premium Forecasting

Premium Planning

Knows the Market

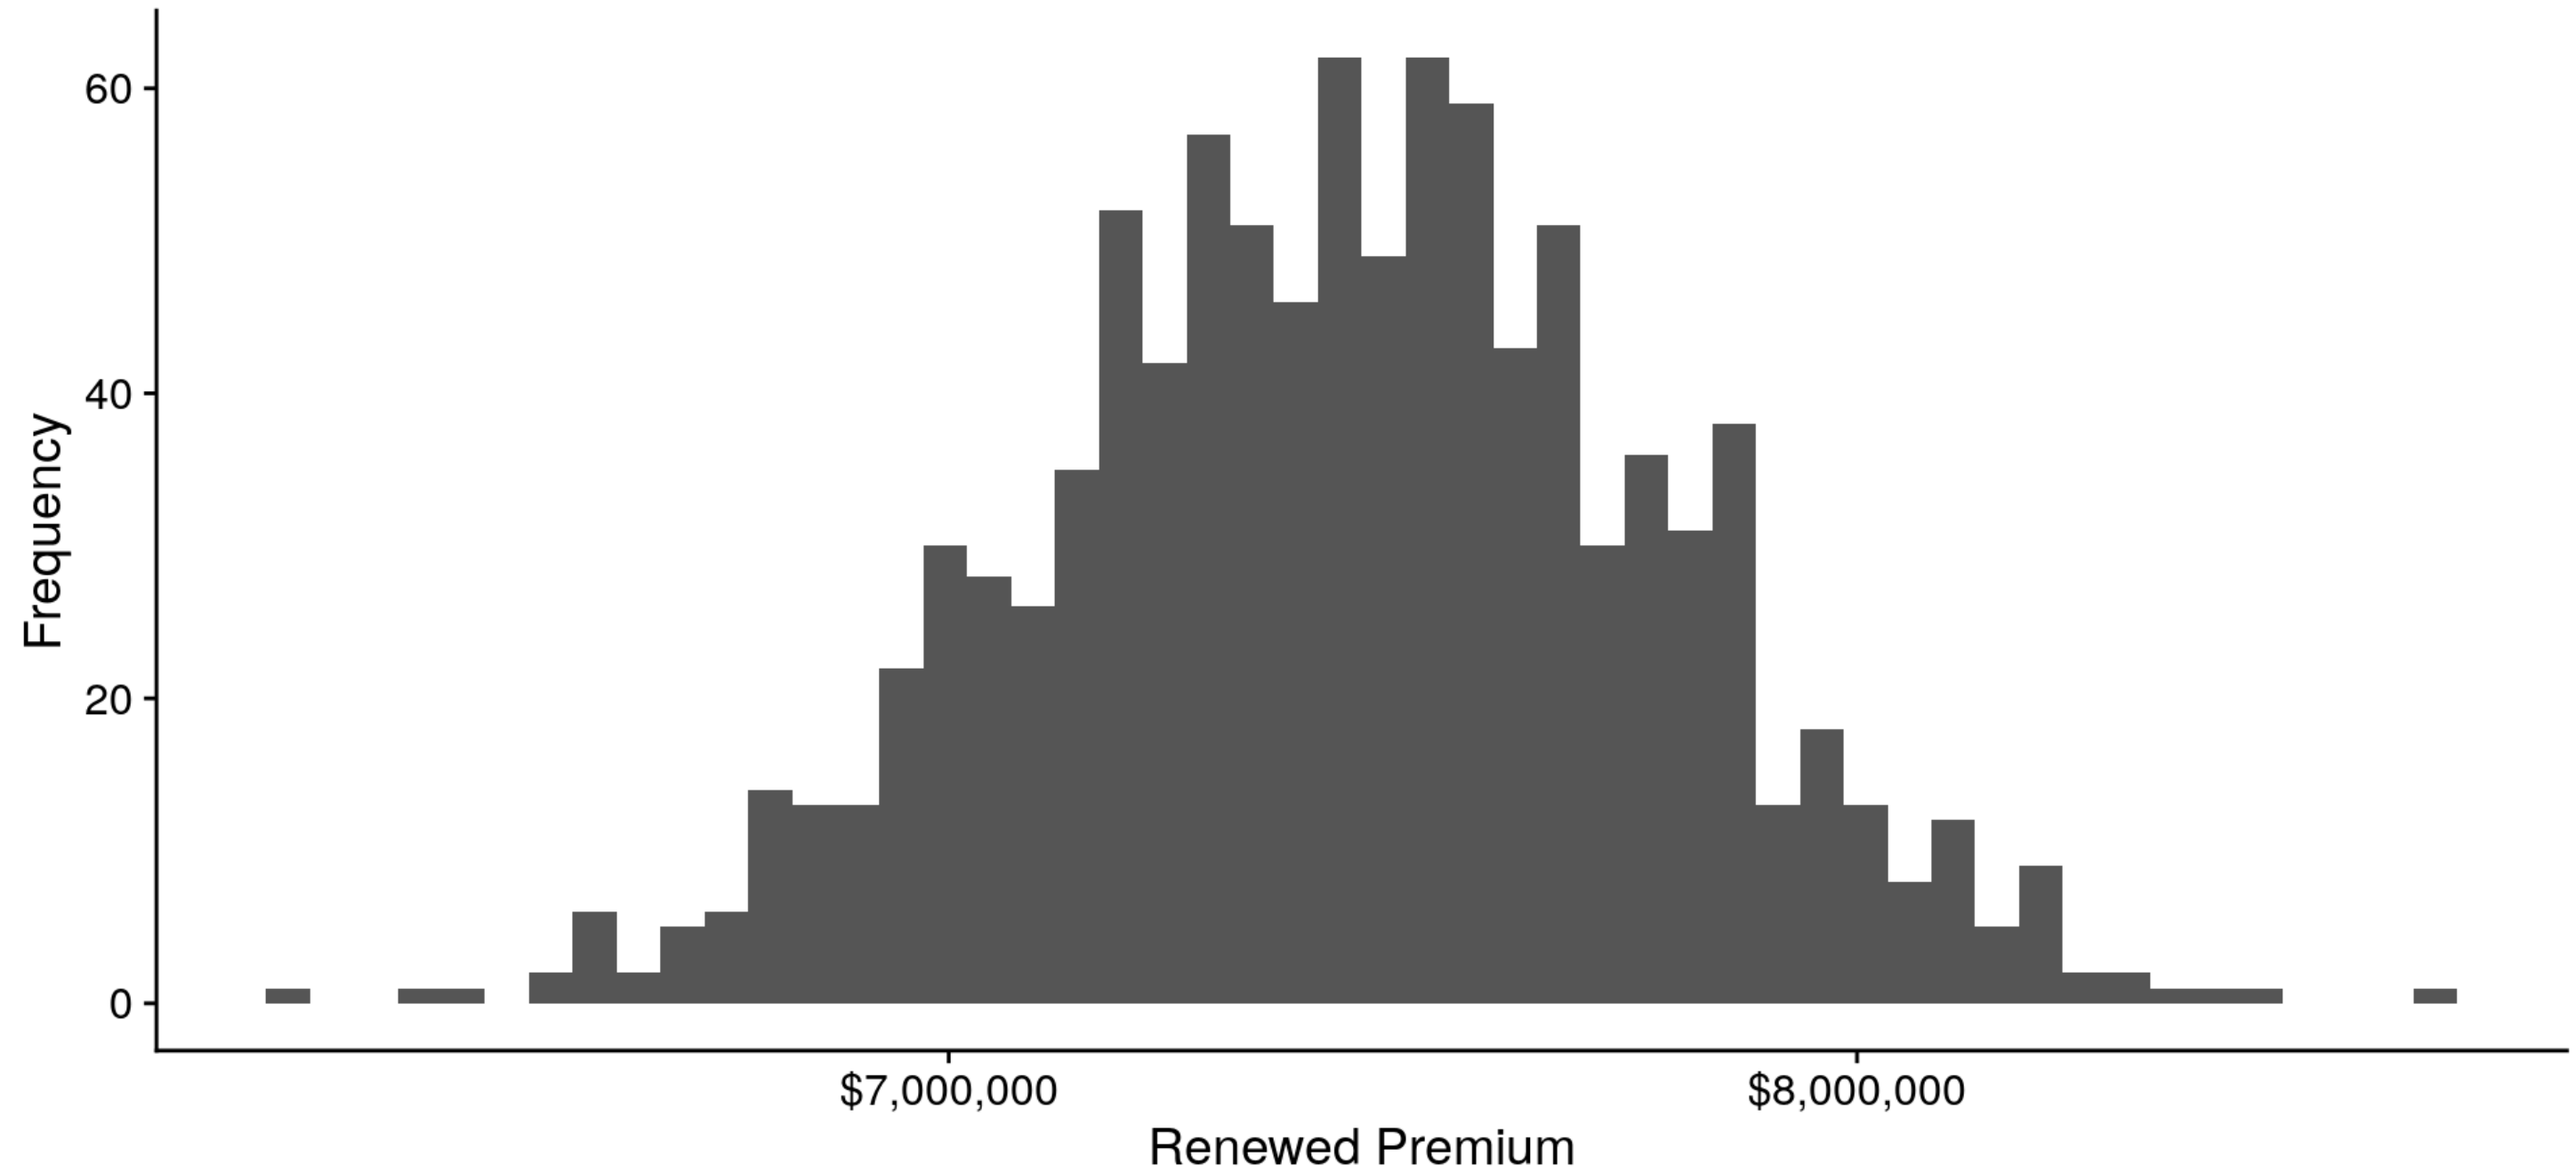

Policy_Number	Company_Sector	Company_Name	Premium	Retention
GL00001	Technology	Technology Co 2	\$40,404	Medium
GL00002	Technology	Technology Co 3	\$41,952	Low
GL00005	Healthcare	Healthcare Co 6	\$32,854	Medium
GL00007	Construction	Construction Co 8	\$26,090	High
GL00008	Healthcare	Healthcare Co 9	\$25,467	Medium
GL00009	Renewable Energy	Renewable Energy Co 10	\$81,331	Medium
GL00012	Technology	Technology Co 13	\$37,076	High
GL00013	Renewable Energy	Renewable Energy Co 14	\$68,826	Low
GL00014	Renewable Energy	Renewable Energy Co 15	\$50,257	High
GL00015	Renewable Energy	Renewable Energy Co 16	\$34,535	High

Assigned High, Medium, Low chances of the retaining
policy

Assign probability for policy

Run simulations

Histogram of Total Renewed Premium for Planning

Premium Planning

US Liability Business

Grow from 60mm USD to 80mm USD

Where does the premium come from?

Northeast US -> 10mm

Healthcare sector -> 5mm

Small business -> 5mm

Co-occurrence of Risk Factors

Allocate by simulating policies

Also allocates across other policies

Premium: \$15.38M

Distribution Percentile 95%

95% TVaR: \$23.17M

Cumulative

Proper use may require rethinking relationships

Summary

Random Portfolios are a powerful idea

Lots of use cases in insurance

Requires computational power

Thank You!
